10. Settings

1. Introduction and Login

This software supports the inventory and rental management of event technology: from article and asset-tag management through customer management to the actual rental process, including a checkout and return checklist, a calendar overview, and a maintenance (RMA) module. This document walks through the main functional areas.

Logging in

After opening the application in your browser, the login page appears. Sign in with your email address and password. If a second factor (authenticator app or email code) is set up for your account, you will then be asked to enter that code. Alternatively, if configured, you can sign in with a passkey.

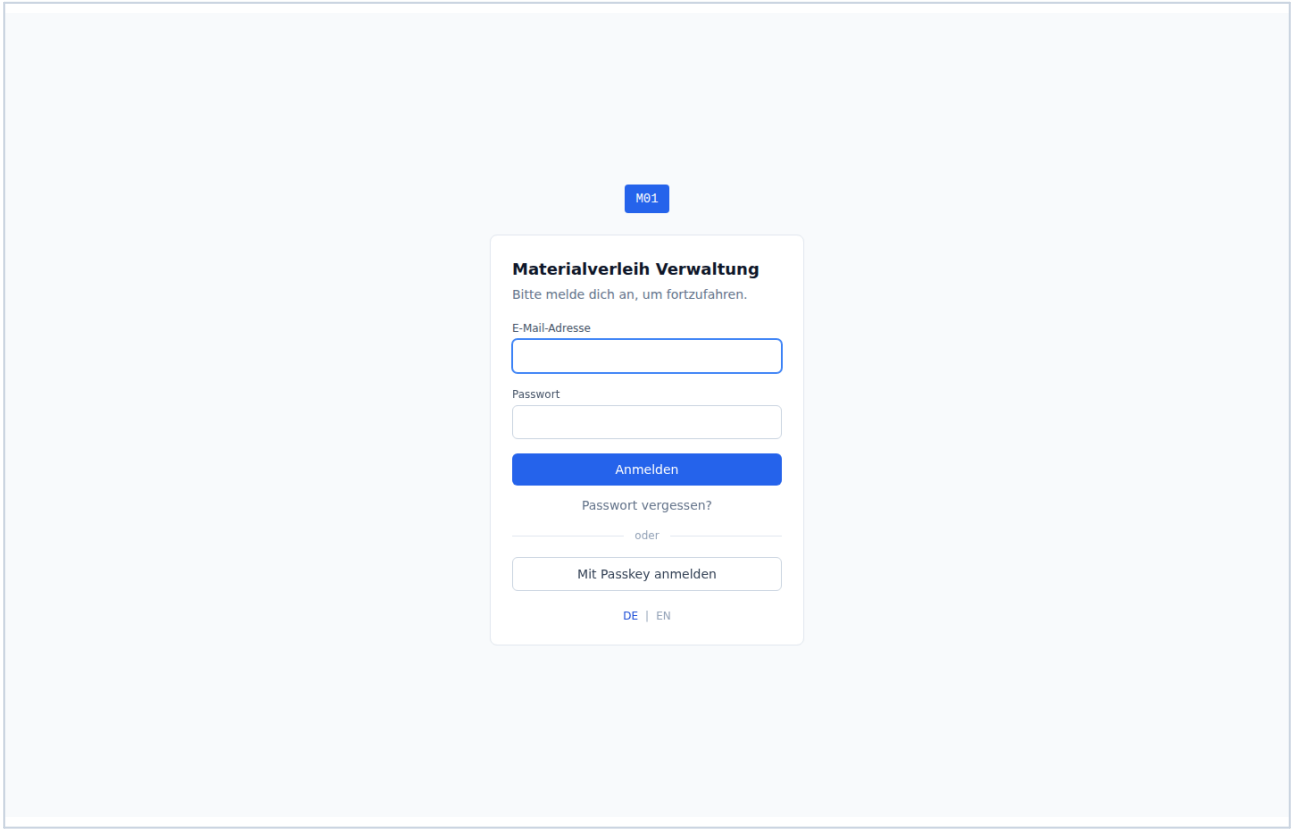

Figure 1: Login page

Note: After repeated incorrect password attempts, or if an account has been deactivated, login is refused. In that case, contact an administrator to have your password reset.

2. Main Menu Overview

After logging in, the main navigation appears at the top. Which menu items you see depends on the permissions assigned to you (see Chapter 9 — User Management). The main areas are:

- **Articles** — article catalog, cases, manufacturers and categories
- **Customers** — customer management for private and business customers
- **Suppliers** — supplier records for purchasing/renting in equipment
- **Rentals** — create rentals, handle checkout/return
- **Calendar** — monthly overview of which equipment is out and when
- **Vehicles** — fleet records for load planning
- **Vouchers** — manage discount codes (visible to administrators only)
- **RMA** — cross-article overview of all maintenance/repair cases

The top-right corner also has a dark-mode toggle, a gear icon for settings, and the user menu, which gives access to your own security/password settings and — for administrators — to user management and SMTP settings.

3. Article Management

The "Articles" area manages every rentable device and accessory. Each article belongs to a manufacturer and, optionally, a category, carries a short prefix (e.g. "FMS" for a wireless microphone set), and can have a weight, dimensions, a purchase price, and a daily rental price.

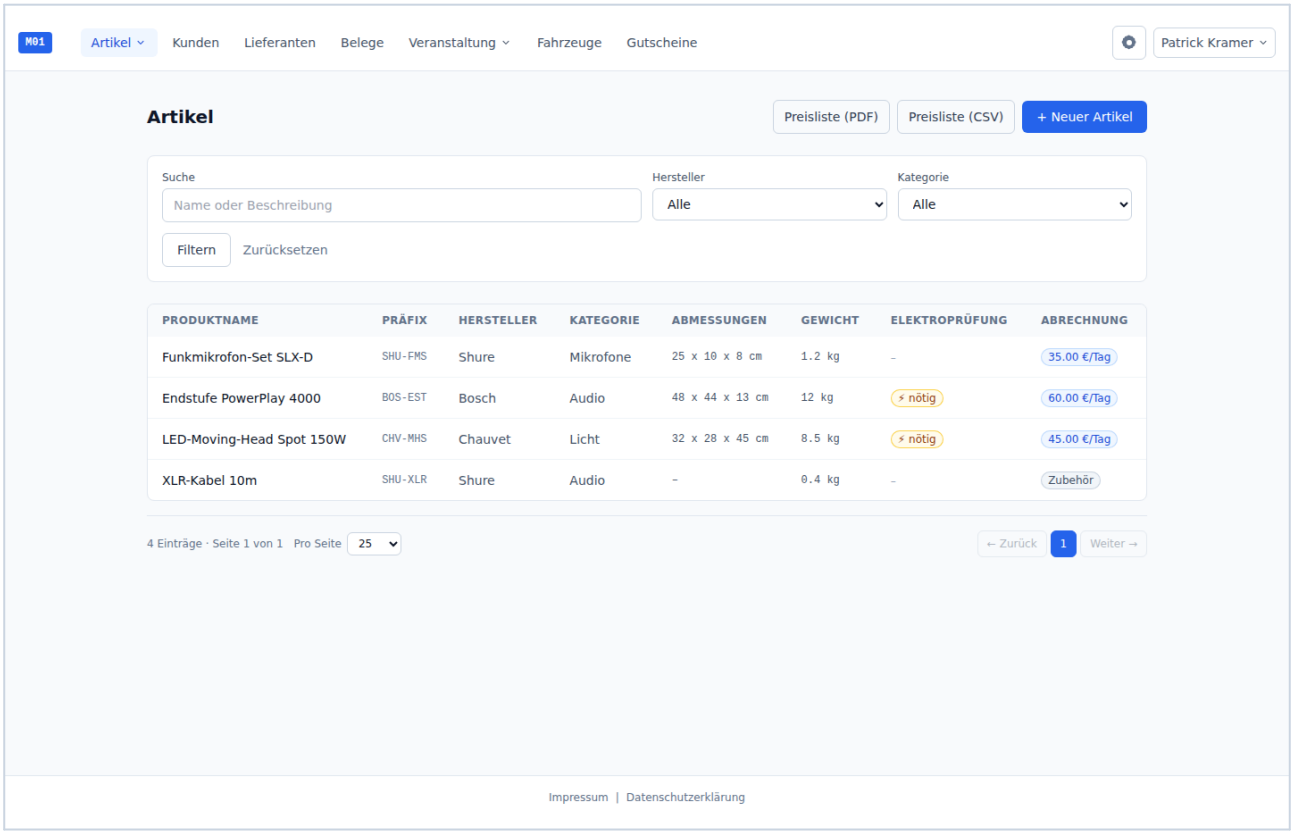

Figure 2: Article list with search and filters

Key fields and functions

- **Prefix:** combined with the manufacturer's prefix to automatically form a unique asset tag, e.g. `BOS-EST-0001`.
- **Billing:** an article is either "billable" (its own line item with a daily price on a rental) or an "accessory" (not billed separately, e.g. a cable).
- **Electrical inspection required:** flags devices that need a recurring safety inspection (e.g. the German DGUV V3 standard).
- **Asset tags:** on the article detail page, you can add any number of physical units, each with an acquisition date, supplier and, optionally, its own purchase price if it differs from the article's; each unit has its own detail page with a rental history.
- **Availability calendar:** on the article detail page, a traffic-light calendar shows how many units are already booked on which day.

"Price list (PDF)" and "Price list (CSV)" let you export the current article list, for example for customer inquiries.

4. Customer Management

The "Customers" area manages all private and business customers. For business customers, the company name is required; for private customers, first and last name are enough. You can also store an address, phone number and email address — phone number and email are clickable directly in the list (they open the phone or mail app).

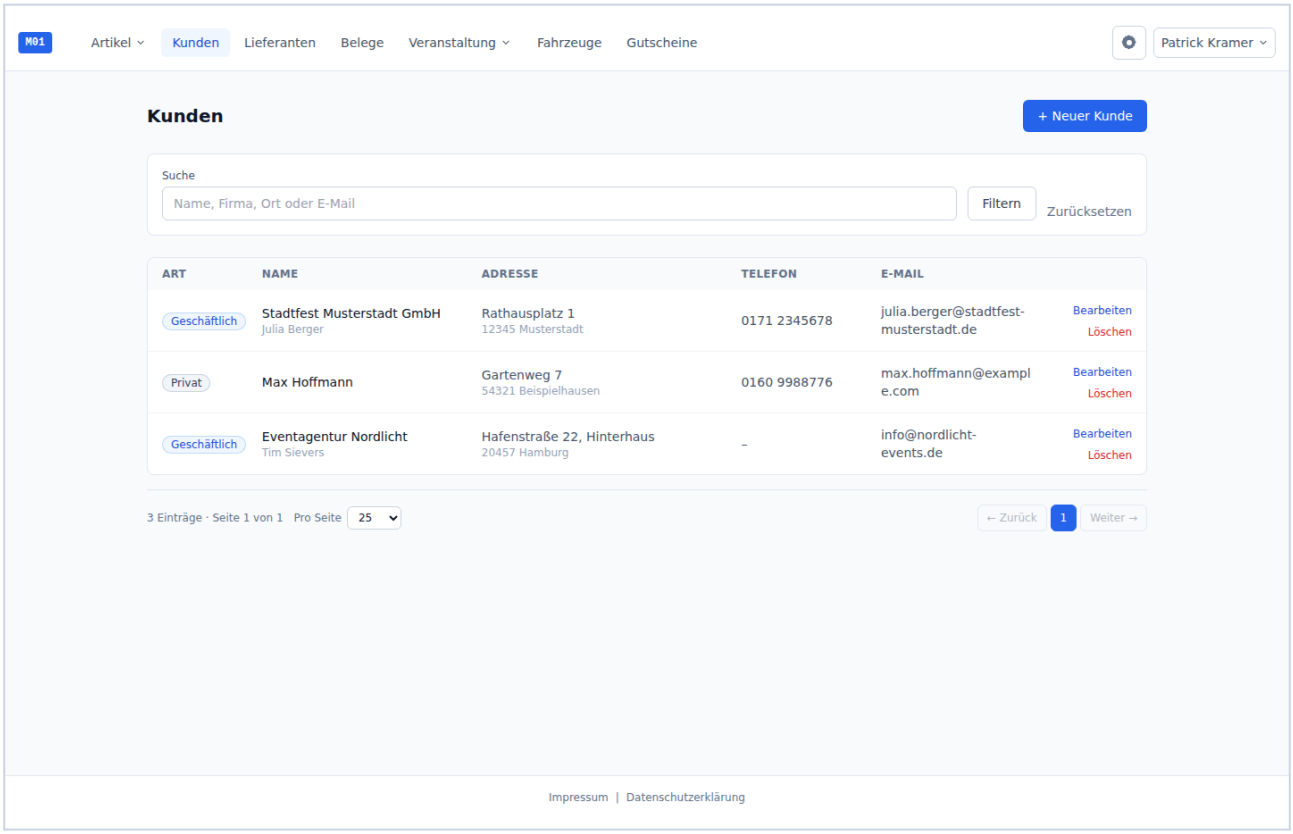

Figure 3: Customer list

The free-text search at the top searches name, company, city and email address at the same time. "+ New customer" takes you to the creation form.

5. Rentals and Calendar

A rental ties together a customer, a date range, an event name and the planned articles. When creating one, you choose the customer, the date range and the actual number of deployment days (at most the number of days in the chosen range) — relevant later for billing articles that are charged per day.

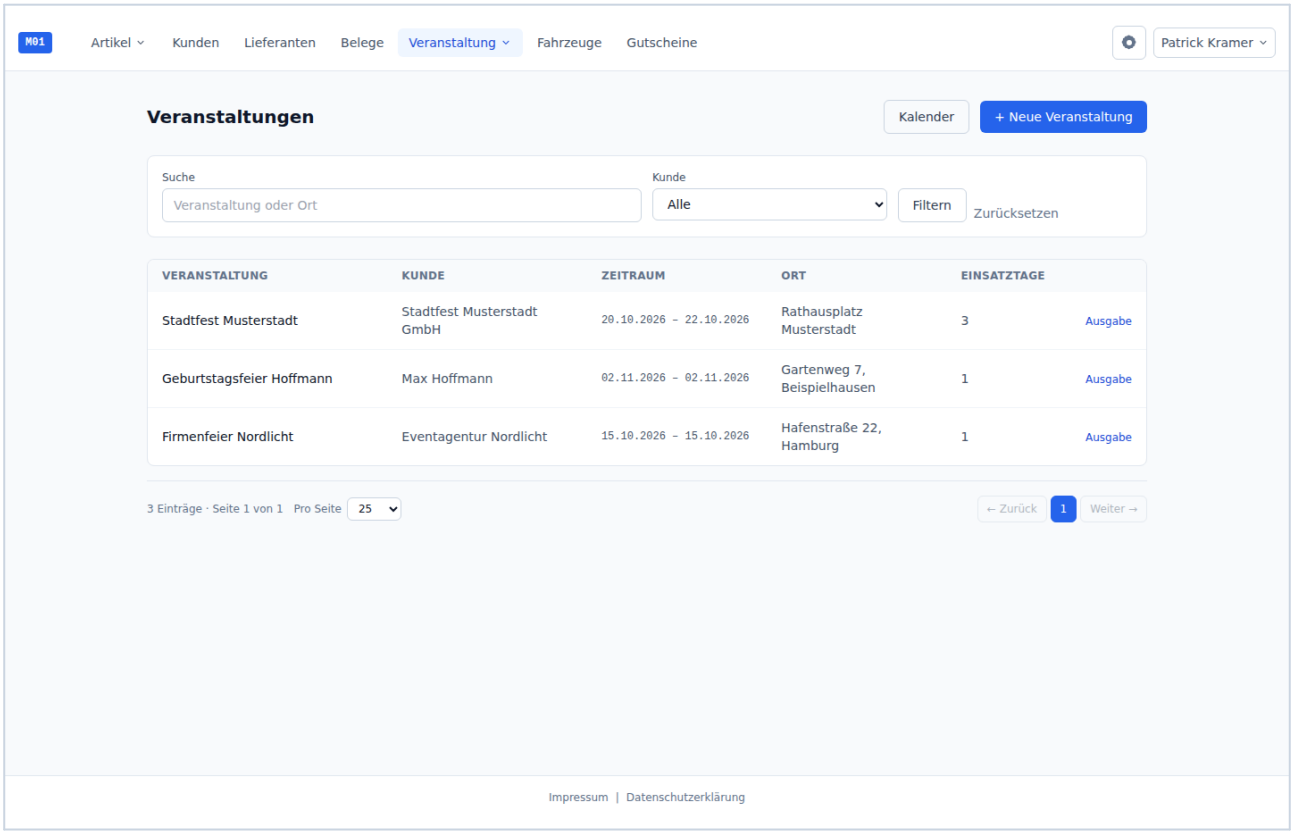

Figure 4: Rental list

On the rental detail page, planned articles are added with a quantity. From there you can also reach the checkout checklist, the return checklist, and — if vehicles are assigned — the loading list.

Calendar view

The calendar view shows, month by month, which equipment is out on which day. As long as nothing has been checked out yet, the planned articles are shown; after checkout, the actual issued equipment is shown instead, identified by its asset tag. Clicking an event opens the corresponding rental detail page.

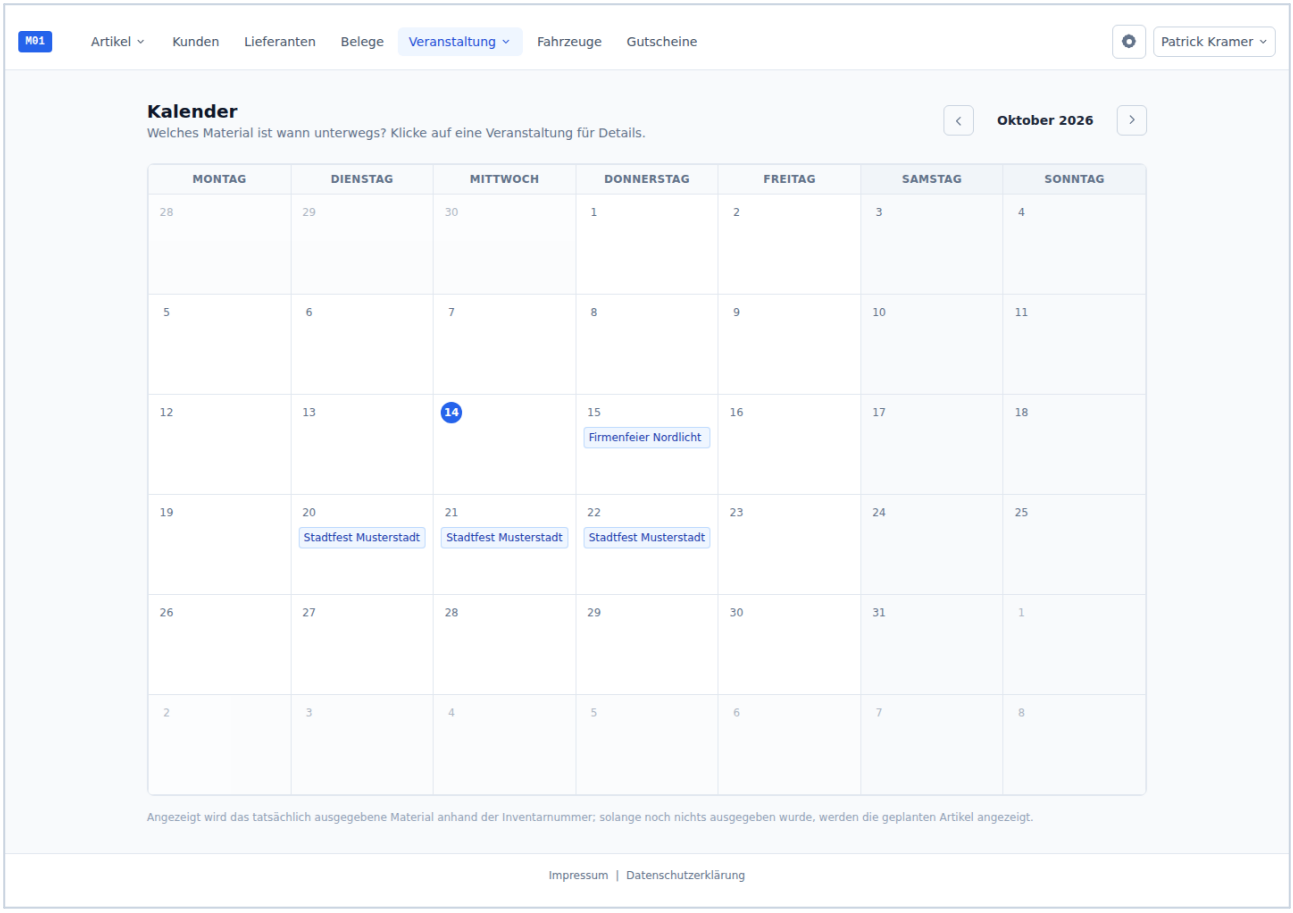

Figure 5: Monthly calendar

6. Checkout and Return

When equipment is handed out, every asset tag that is actually issued is recorded on the **checkout checklist** — either via a dropdown or conveniently with a barcode scanner (the input field is focused automatically). For articles with accessories attached, a dialog for confirming completeness also appears.

On return, the **return checklist** works the same way — additionally, a brief function test is confirmed for each returned unit. If the function test fails, the software automatically creates an RMA case for that unit, so the maintenance/repair case doesn't need to be entered separately (see Chapter 7).

Note: A recorded checkout or return can be undone if needed (e.g. to correct a mistake). Any RMA case that was already created automatically remains unaffected.

7. RMA and Maintenance Management

Every device (every asset tag) can have any number of RMA cases — for example for a manufacturer repair or an in-house repair. Recorded details include the reason, the service provider, the RMA reference number, ship/return dates, and any number of attached documents (e.g. invoices or emails saved as PDF).

The status of an RMA case is derived automatically from the date fields, so it is always consistent:

- **Open** — not yet shipped
- **In transit** — shipped, no return recorded yet
- **Completed** — returned

In addition to recording cases per asset tag, the "RMA" item in the main menu provides a cross-article overview of all cases with status and free-text filters:

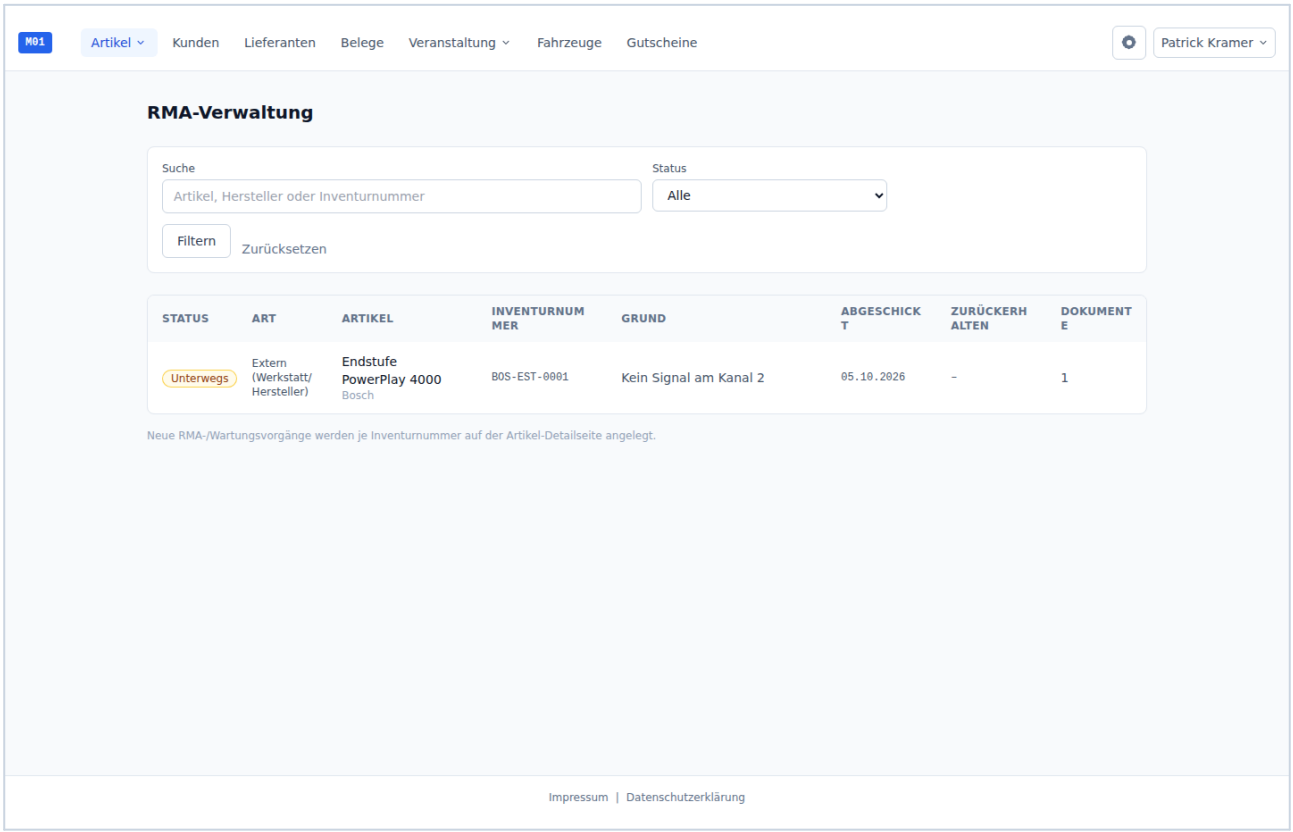

Figure 6: Cross-article RMA overview

8. Vouchers

This area is visible to administrators only. A voucher consists of an automatically generated, unique code, a discount type (percentage or fixed amount), a validity period, and optional notes.

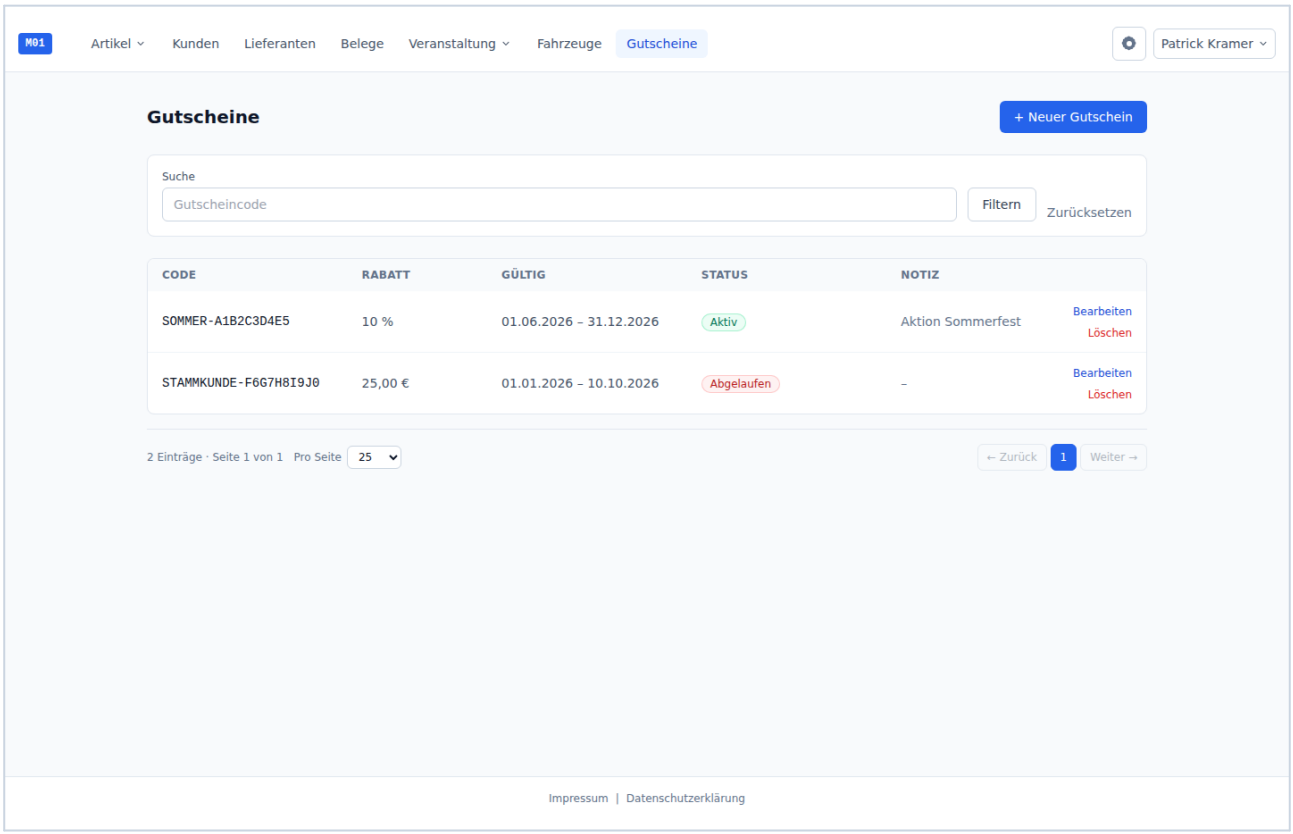

Figure 7: Voucher management

A voucher can be assigned to ("redeemed against") exactly one rental — this is done directly on the rental detail page by entering the code. A redemption can be removed again; the voucher itself is kept and can then be redeemed again. A voucher cannot be deleted while a redemption exists. The default validity period for newly created vouchers can be set centrally under "Settings → Vouchers".

9. User Management and Administrator Impersonation

"User management" (visible to administrators only) is where all user accounts are created and maintained. Each user can be assigned any combination of the following four permissions:

- **Administration** — automatically includes all other permissions
- **Article management** — articles, cases, manufacturers, categories
- **Customer management** — customers and suppliers
- **Checkout and return** — rentals, checkout/return checklist

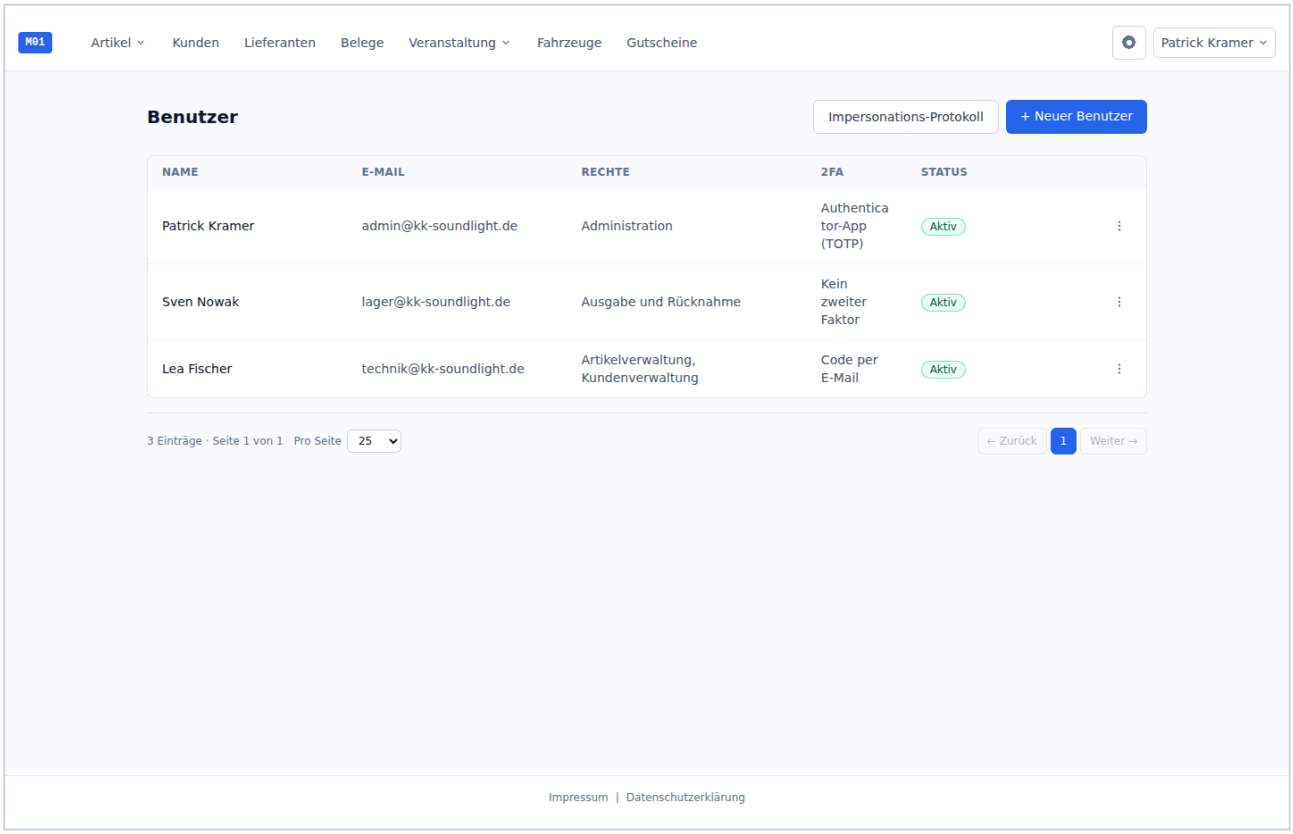

Figure 8: User management

Additionally, each user can be required to use a second factor (authenticator app or email code), be forced to change their password, or have their account deactivated.

Administrator impersonation

When needed — for example for troubleshooting or support purposes — administrators can temporarily sign in as another, non-administrative user. This is started from the "Sign in as this user" action in that user's row dropdown menu. While an impersonation is active, a clearly visible banner appears at the top with an option to return to your own account immediately at any time.

- Impersonating an administrator account, or yourself, is not possible.
- Every impersonation is logged with a start and end time in the impersonation log ("Impersonation log" on the user list), so it can always be traced.
- There is no automatic time limit — an impersonation continues until it is actively ended or the session ends.

10. Settings

The gear icon in the top-right corner takes you to the settings. Depending on your permissions, the following areas may be available there, among others:

- **Appearance** — dark mode, preferred language, default page size for lists
- **Company details** — company name/logo, used on documents and the login page
- **SMTP** — central email credentials for the application's outgoing mail
- **Pricing** — company-wide base pricing settings
- **Vouchers** — default validity period for newly created vouchers

Depending on your deployment, additional organization-specific settings areas may be present (e.g. invoice/quote templates or calendar synchronization).

If you have questions or run into problems, please contact the administrator of your installation.
